

CLICK-A-THON 2026 · ATLYS TRACK

Schema Kings

From feature spec to trusted tables, fresh context, and answers you can act on.

Team **Query Kings** · Shivam Taneja · Divyansh Gupta
schema-kings.onrender.com · [Demo video](#)

THE PROBLEM

Shipping is fast. Insight isn't.

Every product team that ships features hits the same wall.

- New feature goes live before the warehouse is ready
- Tracking, schema, and analysis lag behind
- Context dies across product ↔ eng ↔ data handoffs
- You get charts of *what* – rarely a clear *why*

THE SOLUTION

One agentic loop on ClickHouse

Bring a feature spec + sample events. Schema Kings does the rest.

1. Instrument

Design schema, load Silver, validate – with repair loops and guardrails.

2. Remember

Context layer updates only after validation. Failed runs don't poison memory.

3. Explain

Ask product questions. Get evidence-backed answers – pattern + why.

HOW IT WORKS

Three agents. Shared warehouse memory.

- **Instrumentation** – spec → Bronze → schema/critic → Silver → Gold
- **Context** – `context.\*` registries in ClickHouse
- **Analytics** – plan → guarded SQL → evidence critic

DATA PATH

Bronze → Silver → Gold

Artifacts in `ops.job_artifacts`. Every run traced in Langfuse. Hybrid trust: LLMs draft; ClickHouse + validators decide.

WHAT'S LIVE

Demo & proof

- All 5 known specs + sealed 6th (Promo / Coupon) instrumented
- Report UI: schema, context changelog, Ask
- Hosted: **schema-kings.onrender.com**
- Graded outputs in `artifacts/` (DDL, context diffs, asks, 6th bundle)

Same loop is ready for surprise-round scrutiny – schema + insight + trace.

WHY US

Built for trust, not just demos

- Context writes gated on Silver validation
- Read-only SQL + evidence critic on answers
- Full Langfuse traces for every agent run
- ClickHouse-native – warehouse, memory, and artifacts in one place

QUERY KINGS

Schema Kings

Spec in. Trusted insight out.
