

LIVATHON

PROJECT :

Counting the crowd: foreground-only concurrency at streaming scale

■ Track

Real-time analytics

■ Team

RUDRA

■ Stack

ClickHouse · Librechat · Clickstack

■ Demo day

August 1st, 2026

Teams are drowning in events and starved for answers.

We measure true active playback, not just open sessions — by combining session boundaries with heartbeat signals to filter out backgrounded time. The result: concurrency numbers you can trust, computed on aggregated tables built for fast queries and easy updates, even at massive scale.

- **Dashboards lag** — Queries over large chunks of data add delay in bringing the latest output.
- **Events arrive late** — Out of order events can cause anomalous behavior and causes problems while computing real view counts.
- **Costs** — Scaling row-stores to keep up burns budget fast.

THE COST OF INACCURATE DATA

Inaccurate metrics can cost both the broadcaster as well advertisers resources and money without getting an accurate evaluation for their media streams.

LIVATHON turns the firehose into sub-second insight.

We built LIVATHON — as a thin, real-time analytics layer that sits on your event streams and answers questions the instant they're asked. With minimal wait time.

01

Stream-native ingest

Events land from into ClickHouse in real time — no batch jobs, no stale windows.

02

Ask anything, instantly

Ad-hoc SQL over raw events returns in minimal time, so you explore instead of wait.

03

Live, not lagging

Fast refreshing views and alerts fire the moment thresholds are crossed.

Sub-second from ingest to insight.

Why it's fast: materialized views pre-shape hot paths while raw events stay queryable — ClickHouse does the heavy scan in milliseconds.

04 Overview of the product

LIVATHON contains a major collection of filters granting multiple granular insights for multiple conditions.

04 Overview of the product

LIVATHON contains a major collection of filters granting multiple granular insights for multiple conditions.

Numbers from the 24-hour build.

query	base <code>hist_minute_full</code>	rollup tier	speedup	serving table
total	8 ms · 663,151 rows	5 ms · 8,192	81x fewer rows	<code>dim_minute (_total)</code>
<code>platform=...</code>	10 ms · 663,151	7 ms · 16,384	40×	<code>dim_minute</code>
<code>video_type=...</code>	9 ms · 663,151	6 ms · 7,521	88×	<code>dim_minute</code>
multi-dim (3 filters)	18 ms · 663,151	7 ms · 24,576	27×	<code>concurrency_1m</code> (dims-first)
<code>content_id=...</code>	19 ms · 663,151	6 ms · 8,192	81×	<code>dim_minute</code>

See it live.
